RESTARTING YOUR PLANT AFTER SHUTDOWN –  
LETS US CONTRIBUTE TO SAFEGUARDING  
YOUR PRODUCTION PROCESS

[edwardsvacuum.com/service](https://edwardsvacuum.com/service)

Dear,

We wish you and your family are safe and doing fine in these tough times. Due to lockdown and other measures taken in the fight against COVID-19 virus are restricting us as a society and have also led to plant shutdowns as well as disruptions in production. Following the pandemic, restarting the plants in a controlled manner will be necessary. Because in Edwards we believe safety comes first and we need to guarantee their value, functionality and safety, in addition to the safety of our employees. Edwards equipment is essential in many manufacturing applications, and we will contribute to safeguarding your production process.

Shutdown for an extended period can cause some unexpected events when eventually equipment is restarted. To avoid problems we recommend:

- Flush the pump and change the oil: contamination present in the oil can leave deposits that block lubricating parts affecting the pump performance and lifetime.
- Replace shaft seals: shutdown may have caused some internal parts to deform, leading to internal leaks and poor operation.

To ensure proper and safe restarting we recommend that our customer service team accompany you. Our start-up support and assisted plant recommissioning can help prevent serious issues, as nothing is more expensive and time-consuming than a plant with limited functionality.
